NAME

dh_quilt_unpatch − unapply patches listed in debian/patches/series

SYNOPSIS

dh_quilt_unpatch [*debhelper options*]

DESCRIPTION

dh_quilt_unpatch simply calls **quilt pop −a** after having set the environment variable **QUILT_PATCHES** to **debian/patches**. All patches listed in **debian/patches/series** are then unapplied in the current directory. The command does not fail if the patches have already been unapplied.

You can use another directory instead of **debian/patches** by setting (and exporting) the environment variable **QUILT_PATCH_DIR**.

EXAMPLES

dh_quilt_unpatch is usually called indirectly in a rules file via the dh command.

```
%:
        dh $@ --with quilt
```

It can also be direcly called in the clean rule.

```
clean:
        dh_testdir
        dh_testroot
        [ ! -f Makefile ] || $(MAKE) clean
        dh_quilt_unpatch
        dh_clean
```

NOTES

This tool is useless if you use the source package format **3.0 (quilt)**. Consider switching to this source format if you haven't done it yet.

SEE ALSO

debhelper (7), **dh** (1).

This program is meant to be used together with debhelper.
