NAME
>   vimdiff − edit two, three or four versions of a file with Vim and show differences

SYNOPSIS
>   **vimdiff** [options] file1 file2 [file3 [file4]]
>
>   **gvimdiff**

DESCRIPTION
>   **Vimdiff** starts **Vim** on two (or three or four) files. Each file gets its own window. The differences between
>   the files are highlighted. This is a nice way to inspect changes and to move changes from one version to
>   another version of the same file.
>
>   See vim(1) for details about Vim itself.
>
>   When started as **gvimdiff** the GUI will be started, if available.
>
>   In each window the 'diff' option will be set, which causes the differences to be highlighted.
>   The 'wrap' and 'scrollbind' options are set to make the text look good.
>   The 'foldmethod' option is set to "diff", which puts ranges of lines without changes in a fold. 'foldcolumn'
>   is set to two to make it easy to spot the folds and open or close them.

OPTIONS
>   Vertical splits are used to align the lines, as if the "−O" argument was used. To use horizontal splits instead,
>   use the "−o" argument.
>
>   For all other arguments see vim(1).
