NAME
      setup-packaging-environment – helps one to get started with Ubuntu development

SYNOPSIS
      setup-packaging-environment

DESCRIPTION
      setup-packaging-environment aims to make it more straightforward for new contributors to get their
      Ubuntu installation ready for packaging work. It ensures that all four components from Ubuntu's official
      repositories are enabled along with their corresponding source repositories. It also installs a minimal set of
      packages needed for Ubuntu packaging work (ubuntu-dev-tools, devscripts, debhelper, cdbs, patchutils,
      pbuilder, and build-essential). Finally, it assists in defining the DEBEMAIL and DEBFULLNAME environment variables.
