NAME
disco – Mono's Web Service Discovery Tool

SYNOPSIS
disco [options] url

DESCRIPTION
disco is a tool for discovering web services and for retrieving the documents that describe those services.

url is the location of a DISCO document, which includes a list of WSDL documents, XML schemas and references to other DISCO documents.

disco downloads the DISCO document and all referenced documents (unless the *-nosave* option is specified), and saves them to disk.

OPTIONS
The following options are available:

-nologo

Suppress the startup logo.

-nosave

Do not save the discovered documents to disk. The default is to save the documents.

-o:directory , -out:directory

The directory where to save the discovered documents. By default, documents are saved in the current directory.

-u:username , -user:username

The user name to use when connecting to the server.

-p:password , -password:password

The password to use when connecting to the server.

-d:domain , -domain:domain

The domain to use when connecting to the server.

-proxy:url

The url of the proxy server to use for http requests.

-proxyusername:username

The user name to use when connecting to the proxy.

-proxypassword:password

The password to use when connecting to the proxy.

-proxydomain:domain

The domain to use when connecting to the proxy.
