## NAME

Net::DBus::Binding::Message::MethodCall − a message encoding a method call

## DESCRIPTION

This module is part of the low-level DBus binding APIs, and should not be used by application code. No guarantees are made about APIs under the `Net::DBus::Binding::` namespace being stable across releases.

This module provides a convenience constructor for creating a message representing a method call.

## METHODS

my $call = Net::DBus::Binding::Message::MethodCall−>new( service_name => $service, object_path => $object, interface => $interface, method_name => $name);

Create a message representing a call on the object located at the path `object_path` within the client owning the well-known name given by `service_name`. The method to be invoked has the name `method_name` within the interface specified by the `interface` parameter.
