NAME

   Class::Accessor::Fast – Faster, but less expandable, accessors

SYNOPSIS

```
package Foo;
use base qw(Class::Accessor::Fast);

# The rest is the same as Class::Accessor but without set() and get().
```

DESCRIPTION

   This is a faster but less expandable version of Class::Accessor. Class::Accessor's generated accessors
   require two method calls to accomplish their task (one for the accessor, another for *get()* or *set()*).
   Class::Accessor::Fast eliminates calling *set()*/*get()* and does the access itself, resulting in a somewhat faster
   accessor.

   The downside is that you can't easily alter the behavior of your accessors, nor can your subclasses. Of
   course, should you need this later, you can always swap out Class::Accessor::Fast for Class::Accessor.

   Read the documentation for Class::Accessor for more info.

EFFICIENCY

   "EFFICIENCY" in Class::Accessor for an efficiency comparison.
