NAME

      selection−pastebin − automatic pastebin upload

EXAMPLES

      `URxvt.keysym.C−M−e: selection−pastebin:remote−pastebin`

DESCRIPTION

      This is a little rarely useful extension that uploads the selection as textfile to a remote site (or does other things). (The implementation is not currently secure for use in a multiuser environment as it writes to */tmp* directly.).

      It listens to the `selection-pastebin:remote−pastebin` action, which, when activated, runs a command with `%` replaced by the name of the textfile. This command can be set via a resource:

      `URxvt.selection-pastebin.cmd: rsync −apP % ruth:/var/www/www.ta−sa.org/files/t`

      And the default is likely not useful to anybody but the few people around here :)

      The name of the textfile is the hex encoded md5 sum of the selection, so the same content should lead to the same filename.

      After a successful upload the selection will be replaced by the text given in the `selection−pastebin−url` resource (again, the % is the placeholder for the filename):

      `URxvt.selection-pastebin.url: http://www.ta−sa.org/files/txt/%`

      Note to xrdb users: xrdb uses the C preprocessor, which might interpret the double / characters as comment start. Use `\057\057` instead, which works regardless of whether xrdb is used to parse the resource file or not.
