NAME
>   xml-config - script to get information about the installed version of GNOME-XML

SYNOPSIS
>   **xml-config** [−−prefix*[=DIR]*] [−−libs] [−−cflags] [−−version] [−−help]

DESCRIPTION
>   *xml-config* is a tool that is used to determine the compile and linker flags that should be used to compile and
>   link programs that use *GNOME-XML*. It is highly recommended to use pkg-config instead because build-
>   ing in a multi-arch environment is not well supported in this script.

OPTIONS
>   *xml-config* accepts the following options:

>   **−−version**
>>   Print the currently installed version of *GNOME-XML* on the standard output. Add the **−−static**
>>   option to print the linker flags that are necessary to **statically** link a *GNOME-XML* program.

>   **−−libs**   Print the linker flags that are necessary to link a *GNOME-XML* program.

>   **−−cflags**
>>   Print the compiler flags that are necessary to compile a *GNOME-XML* program.

>   **−−prefix=PREFIX**
>>   If specified, use PREFIX instead of the installation prefix that *GNOME-XML* was built with when
>>   computing the output for the −−cflags and −−libs options. This option must be specified before
>>   any −−libs or −−cflags options.
