NAME

pbuilder−dist−simple − simple multi−release pbuilder wrapper

SYNOPSIS

pbuilder−<*dist***>** *operation* [...]

DESCRIPTION

pbuilder−dist−simple is a wrapper that makes it easy to use pbuilder with chroots for many different Ubuntu distributions. If you need more features than **pbuilder−dist−simple** provides, have a look at **pbuilder−dist**(1).

USAGE

Create one symlink to **pbuilder−dist−simple** for each distribution for which you want a build environment, naming them like "pbuilder−lucid", "pbuilder−natty", etc.

Replace *operation* with the action you want **pbuilder−dist−simple** to do (create, update, build, clean, login or execute).

EXAMPLES

pbuilder−natty create
> Creates a **pbuilder** environment for Ubuntu Natty.

pbuilder−lucid update
> Updates an existing Ubuntu Lucid environment.

pbuilder−lucid build ./sample_1.0−0ubuntu1.dsc
> Builds the specified package on an already existing Ubuntu Lucid environment.

FILES

By default, **pbuilder−dist−simple** will store all the files it generates in **˜/pbuilder/**. This can be changed by modifying the BASE_DIR value on the top of the script to any other directory you want. If the directory doesn't exit, it will be created at runtime.

SEE ALSO

pbuilder(1), **pbuilderrc**(5), **pbuilder−dist**(1)

AUTHORS

pbuilder−dist was originally written by Jamin W. Collins <jcollins@asgardsrealm.net> and Jordan Mantha <mantha@ubuntu.com>, and this manpage by Siegfried−A. Gevatter <rainct@ubuntu.com>.
